

BUCK | Simplify Stable Income ETF

FUND OVERVIEW

The **Simplify Stable Income ETF (BUCK)** seeks to provide monthly income. The fund is actively managed with the goal of creating high risk-adjusted yield through efficient short-term fixed income positioning and structural option-writing opportunities.

The fund is intended to be a cash or fixed income alternative, as it seeks to enhance typical yields of a more traditional, passive investment in short-dated fixed income.

PERFORMANCE REVIEW

BUCK's 4Q returns were predominantly from Treasury Bills and short-term Treasury Inflation-Protected Securities. The options strategies were a drag given challenging market conditions with rates gyrating up to 5% and then quickly reversing to 4%. Equity options strategies faced even greater challenges, on the heels of lower-than-normal levels of option income due to low levels of VIX. BUCK has shifted its focus towards higher-income option strategies with more dynamic hedging in interest rate markets to take advantage of elevated volatility of interest rates and lower tail risk in general in fixed income products. This change will potentially enhance returns without significantly increasing the risk.

Outlook for BUCK is robust given higher than historical average premia in fixed income products and a stabilizing interest rate market. More cost-efficient structures such as options on treasury futures now being available to the fund will also help achieve the desired results.

Performance as of 12/31/23 | Inception Date: 10/27/22

	CUMULATIVE TOTAL RETURN				ANNUALIZED TOTAL RETURN	
	3 Mo	6 Mo	YTD	Since Inception	1 Year	Since Inception

DEFINITIONS

Market Price: The current price at which shares are bought and sold. Market returns are based upon the last trade price.

NAV: The dollar value of a single share, based on the value of the underlying assets of the fund minus its liabilities, divided by the number of shares outstanding. Calculated at the end of each business day.

Option: An option is a contract that gives the buyer the right to either buy (in the case of a call option) or sell (in the case of a put option) an underlying asset at a pre-determined price ("strike") by a specific date ("expiry"). An "outright" is another name for a single option leg. A "spread" is when options are bought at one strike and an equal amount of options are sold at a different strike, all at the same expiry.

SEC 30-Day Yield: The yield is calculated with a standardized formula and represents net investment income earned by a fund over a 30-day period, expressed as an annual percentage rate based on the fund's share price. The yield includes the effect of any fee waivers and/or reimbursements. Without waivers, yields would be reduced. This is also referred to as the "standardized yield", "30-Day Yield" and "Current Yield". The unsubsidized SEC 30-Day Yield does not reflect the effect of any fee waivers and/or expense reimbursements.

Treasury Inflation-Protected Securities (TIPS): A type of Treasury security issued by the U.S. government. TIPS are indexed to inflation to protect investors from a decline in the purchasing power of their money.

VIX Index: A real-time market index representing the market's expectations for volatility over the coming 30 days.

IMPORTANT INFORMATION:

Investors should carefully consider the investment objectives, risks, charges, and expenses of Exchange Traded Funds (ETFs) before investing. To obtain an ETF's prospectus containing this and other important information, please call (855) 772-8488, or visit SimplifyETFs.com. Please read the prospectus carefully before you invest.

An investment in the fund involves risk, including possible loss of principal.

The fund is actively-managed is subject to the risk that the strategy may not produce the intended results. The fund is new and has a limited operating history to evaluate. The Fund invests in ETFs (Exchange-Traded Funds) and entails higher expenses than if invested into the underlying ETF directly. The lower the credit quality, the more volatile performance will be. When junk bonds sell off, the lowest-rated bonds are typically hit hardest known as blow up risk. Likewise, the riskiest bonds typically rise fastest in a bull market however these investments that don't have a credit rating are typically the most volatile, hard to price and the least liquid.

The use of derivative instruments involves risks different from, or possibly greater than, the risks associated with investing directly in securities and other traditional investments. These risks include (i) the risk that the counterparty to a derivative transaction may not fulfill its contractual obligations; (ii) risk of mispricing or improper valuation; and (iii) the risk that changes in the value of the derivative may not correlate perfectly with the underlying asset, rate, or index. Derivative prices are highly volatile and may fluctuate substantially during a short period of time. The use of leverage by the Fund, such as borrowing money to purchase securities or the use of options, will cause the Fund to incur additional expenses and magnify the Fund's gains or losses. The Fund's investment in fixed income securities is subject to credit risk (the debtor may default) and prepayment risk (an obligation paid early) which could cause its share price and total return to be reduced. Typically, as interest rates rise the value of bond prices will decline and the fund could lose value.

While the option overlay is intended to improve the Fund's performance, there is no guarantee that it will do so. Utilizing an option overlay strategy involves the risk that as the buyer of a put or call option, the Fund risks losing the entire premium invested in the option if the Fund does not exercise the option. Also, securities and options traded in over-the-counter markets may trade less frequently and in limited volumes and thus exhibit more volatility and liquidity risk.
