

## HEQT | Simplify Hedged Equity ETF

### Overview

The Simplify Hedged Equity ETF seeks to provide capital appreciation by offering US large cap exposure while investing in a series of put-spread collars designed to help reduce volatility.

Equities + put-spread collars have become a popular way to create more conservative, lower volatility equity investments. By deploying a ladder of collars, that expire over 3 sequential months, the fund seeks to create a hedged equity experience that is additionally robust to rebalancing luck.

### Key Points

- **Low-cost<sup>1</sup> US large cap index ETF is the core equity exposure**
- **Put-spread collars covering 100% notional of the equities are deployed to mitigate volatility**
- **First hedged equity ETF utilizing a ladder of collars to improve rebalancing luck**

<sup>1</sup>Normal Brokerage Fees Apply

### Strategy Design

#### Passive US Equity Exposure

- US large cap index ETF
- Quarterly dividend

#### Advanced Collar Overlay

- A ladder of three put-spread collars, expiring over the next three consecutive months, is deployed to smooth out rebalancing luck associated with a single quarterly collar
- Each collar consists of an approximately 5% OTM to 20% OTM put-spread, that is funded by selling a call

### Portfolio Applications for Hedged Equity

- **Conservative Equities:** Many investors struggle to stay the course with equity investments due to the volatility. By creating a lower volatility equity exposure, those more risk averse clients can look to participate in equity upside.
- **Alternative Low Volatility Investments:** With bond yields near all time lows, investors are searching for alternatives for their lower volatility investments. The reduction in volatility offered by hedged equity creates this alternative for investors.

### DEFINITIONS:

**Expiry:** The time until an option expires. In the context here expiry is used to describe the length of time from when an option position is initiated to when it will expire.

**NAV:** The dollar value of a single share, based on the value of the underlying assets of the fund minus its liabilities, divided by the number of shares outstanding. Calculated at the end of each business day.

**Market Price:** The current price at which shares are bought and sold. Market returns are based upon the last trade price.

**Notional Exposure:** The full market exposure a derivatives contract provides after accounting for the leverage embedded in the derivative, expressed as a percentage of the fund's total assets. We assume each option's delta (sensitivity to changes in underlying security) is 1 in this calculation, implying that we are measuring the exposure afforded by the options in the instance where extreme markets are being realized. This metric provides a measure of the protection afforded to the underlying security by a given option position.

## DEFINITIONS CONTINUED:

**OTMness:** Stands for out-of-the-moneyness and represents how far the option strike is from current market price. In the context here OTMness is used to describe how far the option strike is from the market price when the option position is initiated.

**Put-Spread Collar:** An options strategy that involves buying OTM put options while simultaneously selling the same number of puts further OTM (put-spread), while offsetting the cost of the put-spread by selling OTM calls (the collar).

**Options:** An option is a contract that gives the buyer the right to either buy (in the case of a call option) or sell (in the case of a put option) an underlying asset at a pre-determined price by a specific date. Options are a powerful tool for creating a wide array of payoff profiles and can be used on a standalone basis or integrated into a broader portfolio strategy.

## IMPORTANT INFORMATION:

**Investors should carefully consider the investment objectives, risks, charges, and expenses of Exchange Traded Funds (ETFs) before investing. To obtain an ETF's prospectus containing this and other important information, please call (855) 772-8488, or visit [SimplifyETFs.com](https://SimplifyETFs.com). Please read the prospectus carefully before you invest.**

**An investment in the fund involves risk, including possible loss of principal.**

The fund is actively-managed is subject to the risk that the strategy may not produce the intended results. The fund is new and has a limited operating history to evaluate.

The use of derivative instruments involves risks different from, or possibly greater than, the risks associated with investing directly in securities and other traditional investments. These risks include (i) the risk that the counterparty to a derivative transaction may not fulfill its contractual obligations; (ii) risk of mispricing or improper valuation; and (iii) the risk that changes in the value of the derivative may not correlate perfectly with the underlying asset, rate, or index. Derivative prices are highly volatile and may fluctuate substantially during a short period of time. The use of leverage by the Fund, such as borrowing money to purchase securities or the use of options, will cause the Fund to incur additional expenses and magnify the Fund's gains or losses. Futures may involve risks greater than the risks associated with investing directly in securities. Futures contracts may not correlate with the underlying investment or it could become mispriced or improperly valued and may not produce the desired investment results.

The Fund invests in ETFs (Exchange-Traded Funds) and is therefore subject to the same risks as the underlying securities in which the ETF invests as well as entails higher expenses than if invested into the underlying ETF directly.

While the option overlay is intended to improve the Fund's performance, there is no guarantee that it will do so. Utilizing an option overlay strategy involves the risk that as the buyer of a put or call option, the Fund risks losing the entire premium invested in the option if the Fund does not exercise the option. Also, securities and options traded in over-the-counter markets may trade less frequently and in limited volumes and thus exhibit more volatility and liquidity risk.
